Today's office hours postponed to tomorrow.

Tomorrow's office hours 11:15 to 12:45.

Amines

amino acid
rotting fish makes a lot of amines

Alkyl Halides

Cl^\ominus

Br^\ominus

I^\ominus

Alcohols and Ethers

Thiols and Thioethers

alkyl (adj) form of alkane (n)

\ominus vs \oplus

halogens form stable anions

Organophosphates

glucose-6-phosphate

$R_1 = \text{CH}_3$ $R_2 = \text{CH}_3, \text{CH}_2\text{CH}_3, \text{CH}_2\text{CH}_2\text{CH}_3$

R and X are used as "variables"

R is used for C or H

X is used for elements with lp e^- 's

~~R~~ Cl, Br, I, O, N, S

Both groups will have very \oplus C atoms

Ketones

R_1 or $\text{R}_2 \neq \text{H}$

Aldehydes

R_1 or $\text{R}_2 = \text{H}$

Only 2 atoms connected to the C=O C atom

At least 1 H atom connected to C=O C atom

D-Fructose

D-glucose

Functional Groups: Carbonyl Compounds with Adjacent Polar Groups

Carboxylic Acids and Esters

OH on same C
as C=O C
carboxylic acid
fatty acids

$R_1 = H$ or $R_1 \neq H$

lipids
OC on
same C
as C=O
C

$R_1 = H$ or $R_1 \neq H$ but $R_2 \neq H$

Amides

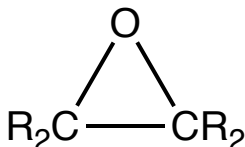

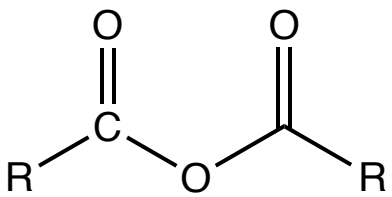

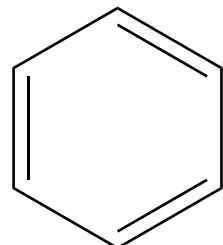

N bonded to C
of C=O
"peptide bond"

3 pairs of e^- 's in a ring
of π bonds

benzene & substituted benzene
rings

Grouped to highlight which ones have similar reactivities

$\text{R}_2\text{C}=\text{CR}_2$ <p>alkenes</p> $\text{R}-\text{C}\equiv\text{C}-\text{R}$ <p>alkynes</p>	$\text{R}_3\text{C}-\text{X}$ <p>X = Cl, Br, I Alkyl Halides</p> $\text{R}_3\text{C}-\text{OH}$ <p>alcohols</p> $\text{R}_3\text{C}-\text{O}-\text{CR}_3$ <p>ethers</p>  <p>epoxides and more...</p>	$\begin{array}{c} \text{O} \\ \\ \text{R}-\text{C}-\text{R}' \end{array}$ <p>ketones (R, R' ≠ H) and aldehydes (R or R' = H)</p> $\text{RC}(=\text{O})\text{NR}_2$ <p>amides</p> $\text{RC}(=\text{O})\text{OR}$ <p>esters (R ≠ H)</p> $\text{RC}(=\text{O})\text{OH}$ <p>carboxylic acids</p>  <p>anhydrides</p> $\text{RC}(=\text{O})\text{Cl}$ <p>acid chlorides</p>	 <p>aromatics and more...</p>

Nomenclature of Alkanes

Early names were based on the number of C atoms in the alkane, and the names came from a variety of places — and we're “stuck” with them for the first four

CH_3OH methanol the name is derived from a word coined by French chemists, Jean-Baptiste Dumas and Eugene Peligot, from “methy” (Greek for alcoholic liquid)” + hylē (Greek for “forest, wood, timber, material”)²
1 C atom

$\text{CH}_3\text{CH}_2\text{OH}$ “eth” to distinguish it from méthylène derived from French and German chemists “äthyl” in German³
2 carbons

$\text{CH}_3\text{CH}_2\text{CO}_2\text{H}$ based on observation that it was the first (shortest chained) carboxylic acid that behaved like a fatty acid

pro (from protos for first) + pion (from pion for fat) => propionic acid⁴

$\text{CH}_3\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ isolated from butter => butyric acid⁵

Nomenclature of Alkanes: Original Scheme based names on number of C atoms present

Sections 3.2 – 3.4

methane	CH_4
ethane	C_2H_6
propane	C_3H_8
butane	C_4H_{10}
pentane	C_5H_{12}
hexane	C_6H_{14}
heptane	C_7H_{16}
octane	C_8H_{18}
nonane	C_9H_{20}
decane	$\text{C}_{10}\text{H}_{22}$
undecane	$\text{C}_{11}\text{H}_{24}$
dodecane	$\text{C}_{12}\text{H}_{26}$

Nomenclature of Alkanes: Original Scheme based names on number of C atoms present

Sections 3.2 – 3.4

methane	CH ₄	1 isomer
ethane	C ₂ H ₆	1 isomer
propane	C ₃ H ₈	1 isomer
butane	C ₄ H ₁₀	2 isomers
pentane	C ₅ H ₁₂	3 isomers
hexane	C ₆ H ₁₄	5 isomers
heptane	C ₇ H ₁₆	...
octane	C ₈ H ₁₈	
nonane	C ₉ H ₂₀	
decane	C ₁₀ H ₂₂	
undecane	C ₁₁ H ₂₄	
dodecane	C ₁₂ H ₂₆	

~~bad idea~~

names will be based on the longest string of C atoms
