emphasize the pairs of  $e^-$ 's

lone-pair  $e^-$ 's are not drawn but are understood to be present...

lone-pair  $e^-$ 's

if the  $e^-$ 's were missing the O atom would have a  $\oplus$  charge ... no  $\oplus$  charge means the O must have a

Chemists use different drawings to place emphasis on different aspects of a molecule.

Representations are used to solve typographical issues.

complete octet ... 2 bonds  
2 sets of  $e^-$ 's

## Molecular Formulas as Compared to Condensed Structures/Structural Formulas

Section 1.12

In organic, molecular formulas are written  $C_xH_y$  (and other elements listed alphabetically)

$C_3H_8O$  this could be 3 different molecules

↑  
# of atoms but no information about  
how they are connected.

These are formulas that show structure but bonds are not drawn.

In organic, condensed structures typically start with a C, and everything immediately to the right of the C is connected to that first C. When the the first C is finally connected to the second C, now that atoms right of the second C are connected to second C. In acyclic unbranched molecules atoms to the right of the second C are not connected to the first C.

In organic, condensed structures typically start with a C, and everything immediately to the right of the C is connected to that first C. When the first C is finally connected to the second C now that atoms right of the second C are connected to second C. In acyclic unbranched molecules, atoms to the right of the second C are not connected to the first C.

Don't put this  $\text{H}$  here

This would have been a  $\text{CH}_3$  if the  $\text{H}$  was supposed to be here, but it's not it's a  $\text{CH}_2$ .

Because bonds are not drawn, condensed structures require the reader to bring some chemical knowledge to their interpretation.

the bracket indicates a bond from  $C_1$  to  $C_3$

redraw to clean up

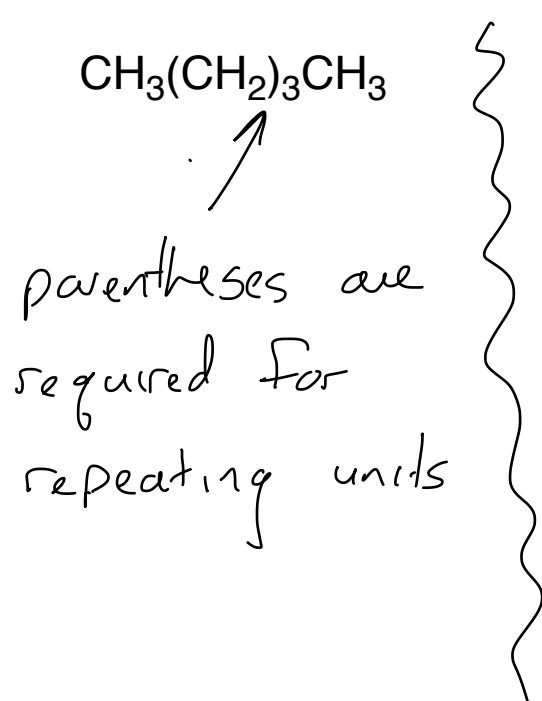

Parentheses ( ) in structures are typically used to set off side chains, to indicate a repeating unit, or to indicate multiple groups of the same structure.

strings of  $\text{CH}_2$ 's are not possible

Often, chemists omit parentheses when they are not absolutely necessary,

parentheses are not really necessary here because there is only 1 way to put these together.

and sometimes chemists do things for aesthetic reasons.

# Convert Condensed Structures to Kekulé Structures

## Section 1.12

branch  
2 CH<sub>3</sub> units

When a **bond ends** and the **atom isn't labeled** it is assumed to be **C**.

When there aren't enough bonds drawn to a C atom, the "missing" bonds are **C atom to H atom bonds**.

All other atoms are labeled.

Heptane  $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$

2-heptanol  $\text{CH}_3\text{CHOH}(\text{CH}_2)_4\text{CH}_3$

Different structures serve different purposes, but they represent the same things

# Converting Between Structure Types
